

- There appears to be a poor appreciation of the Major Hazard risk control loop
- There is a need to improve the understanding of the significance and importance of integrity performance data
- Many managers have failed to prioritise maintenance over projects
- There is a need for long term investment strategies and decision making by senior managers for maintenance of Asset Integrity
- The UK industry does not communicate well across or within companies
- There is a failure to invest in Asset Integrity assurance / safety and an inevitable increase in major hazard risk and reduced production efficiency
